## **Advanced physical models for MQW**

k.p based quantum mechanical solver.

Self-consistent iteration between quantum well solution and drift-diffusion solutions.

Polarization charge model including piezoelectric and spontaneous charges.

State of the art nitride material data macro incorporating latest understanding of mechanisms leading to LED efficiency droop.

Self-consistent coupling of drift-diffusion equation solver and thermal/heat-flow solver.

## Start of the art 3D TCAD tools for LED

User-friendly GUI LayerBuilder used to set up MQW layer structures.

Mask data (usually in GDS format) are used to construct the 3D geometry. Advanced process simulator CSuprem is used to generate the 3D mesh and doping profile.

Efficient and convergent device simulator APSYS is used to simulate electrical behavior (such as IQE) and the thermal behavior.

Optionally Crosslight Optowizard may be used to model the optical extraction behavior with raytracing or FDTD.

Comprehensive 3D TCAD simulation provided by CSuprem and APSYS packages for MQW LED.

Results range from quantum levels, optical transition energies, to 3D temperature and current distribution.

Suitable for practical device optimization with typical simulation time ranging from 20 minutes to several hours depending on the structural complexity.
